date hub protein; Ubiquitin; ligand multispecificity; normal mode analysis; coupling of receptor-ligand motions; functional modes in unbound condition

Abstract
Date hub proteins are a type of proteins that show multispecificity we studied Ubiquitin as a typical example (ligand) heterodimer structures by using normal mode coupled motion of Ubiquitin in the complex, rather than the condition. The ligand-coupled motions are correlated with Ubiquitin. Moreover, ligand-coupled motions favor the motions at the interface. The self-coupled motions at the interface disfavor the formation of the bound state. We conclude that the multispecificity of Ubiquitin can be characterized by an intricate balance of the ligand- and self-coupled motions, both of which are embedded in the motions of the unbound form.

Abstract

SecB, a remarkable chaperone involved in protein export, binds diverse ligands rapidly with site-directed spin labeling and electron paramagnetic resonance spectroscopy were used to investigate the structure of the chaperone SecB. We examined SecB in complex with the unfolded precursor form of outer membrane protein OmpA that includes the transmembrane domain and lacks both the signal sequence and the cytoplasmic tail. In addition, we studied the binding of SecB to the unfolded mature form of galactose-binding protein (GalP). Previously used the same strategy to map the binding surface for the precursor of galactose-binding protein, we tested the patterns of contact are the same.
